

Sleep loss: exhaustion or rising activation?

Original support worksheet | Adults | Reviewed 2026-10-10

Use fictional or appropriately de-identified notes. Write, draw, dictate or point. Not a validated measure, diagnostic test or crisis service.

Sleep opportunity: Time, environment, disruption

Sleep obtained: Approximate timing and quality

Next-day state: Exhausted / sleepy / wired / energized

Associated changes: Mood, activity, decisions, health

Clinical handoff: Pattern + safety + question

Night: opportunity, sleep and disruption

Next day: sleepiness and energy described separately

Associated mood/activity change and baseline comparison

Immediate safety need and agreed contact

Next step: who will do what, by when, and how will we review helpfulness or harm?

Rapid activation with low sleep, acute confusion, dangerous sleepiness, suicidal thinking or inability to function requires timely clinical assessment. Avoid driving or hazardous tasks when unsafe; use local urgent help for immediate danger.
