

Assessment: compare explanations before conclusions

A structured reasoning map for clinicians and supervised interns. Record uncertainty, access conditions, and the decision to be informed.

Referral question / decision

POSSIBLE EXPLANATION	SUPPORTING EVIDENCE	CONTRARY / MISSING	NEXT DISCRIMINATING STEP

Access + safety conditions

Immediate support + preserved goal

Functional outcome + support level + burden

Review date / escalation route

Use the smallest adequate multimethod assessment. A support response informs access; it does not prove etiology. Separate standardized findings from adapted observations. Acute neurological or safety change needs an appropriate urgent route.
